

TRCB017 - CLUB BOX WORKING DOORS

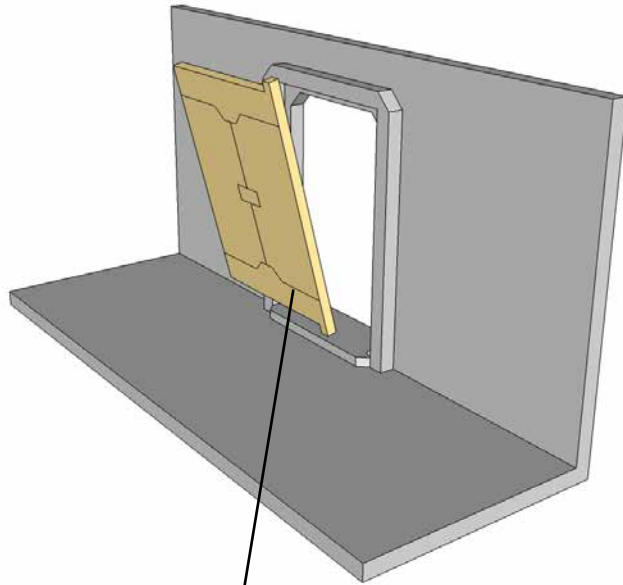

This piece is designed to be inserted on an angle. Look for the square notches and place that inside the door opening on an angle and push it down into place.

Pay attention to the small half circle located on one side. When you are looking at the kit from the outside make sure that hole is on the inside of the model.

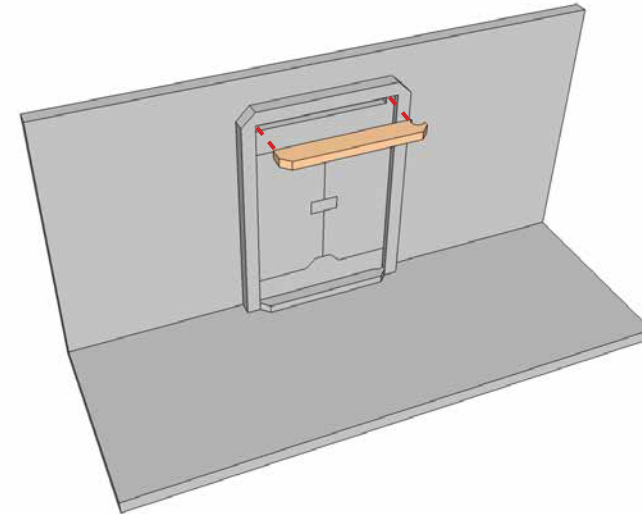

The door frame goes on the inside of the model. The bottom legs of the frame should fit over and around the plate you just inserted. Try to make sure the frame is inserted straight and doesn't dry on an angle.

TRCB017 - CLUB BOX WORKING DOORS

The best way to insert the door is to place the bottom peg in the hold in the bottom door plate and then rotate it up into position. It will sit loosely in place so you might need to hold it whilst you put the top plate in the next step in place.

Once the door is in place you can slide the top plate in. It will slide in above the door and below the door frame. You might need to wiggle it a little so that the circular cutout slips over the small peg at the top of the door.
